99.2%

Pixel fidelity

1,204

Nodes serialized

SUMMARY

Capture cost stopped tracking node count this quarter. The serializer's style cache now survives across captures of the same subtree, so the second capture of a dashboard — the one a user actually waits for — costs about a third of the first. Read the spec at snapdom.dev/docs.

ENGINE TIMINGS

ENGINE	COLD	WARM	NOTES
Chromium 128	42 ms	16 ms	Baseline
WebKit 17.6	63 ms	21 ms	Shadow Y-flip handled
Firefox 129	55 ms	19 ms	No known quirks

Rasterized with `snapdom` ; the text you are selecting is drawn in invisible render mode over those pixels.
